
Subject: Service Classification, Multi-Assignment Logic & Search Architecture – Final Implementation Specification

Please find below the finalized and consolidated implementation specification for the Service Type classification, search logic, backend structure, and UI behavior.

This document replaces all previous partial clarifications and should be treated as the final technical reference for development.

1. SERVICE CLASSIFICATION (MASTER LIST)

No	Arabic Name	English Name	System Code	Technical Note
1	الاستقدام الخارجي (عقد جديد)	Overseas Recruitment (New Contract)	OVERSEAS	Recruitment from origin country
2	نقل خدمات	Sponsorship Transfer	TRANSFER	Transfer within same country
3	عاملات متواجدات داخل الدولة	In-Country Available Workers	LOCAL	Worker already inside service country
4	عقود مرنة محددة المدة	Fixed-Term Flexible Contract	FLEXI	Temporary contract packages
5	خدمة بالساعة	Hourly Domestic Service	HOURLY	Hourly booking model

Important:

- System Codes must be used internally for filtering and reporting.
 - Platform is bilingual (Arabic / English).
 - UI must display only the selected language.
 - Do NOT show Arabic & English together.
 - No stacked dual-language labels.
-

2. FRONTEND – USER SEARCH BEHAVIOR

2.1 Search Flow (Mandatory Order)

Search must follow this exact order:

1. Nationality
2. Service Country
3. Service Type
4. Duration (Visible ONLY when FLEXI is selected)

Filtering must be dynamic and real-time after each selection.

2.2 Service Type Selection Rules

- Service Type must be SINGLE-SELECT.
 - Display as Card-Based Grid Layout (NOT dropdown).
 - Each card must include:
 - Service Name (based on selected language only)
 - One-line description (language-based)
 - Selected card must be clearly highlighted:
 - Border change
 - Background color change
-

2.3 FLEXI Duration Rules

Duration options must:

- Appear ONLY when FLEXI is selected.
- Be displayed as selectable cards (NOT dropdown).
- Be SINGLE-SELECT.

Duration Options:

Arabic	English	Code
شهر	1 Month	M1
شهرين	2 Months	M2
ستة أشهر	6 Months	M6
سنة	12 Months	M12

Duration codes must be stored in backend for reporting.

3. BACKEND – DATA ENTRY & ADMIN LOGIC

⚠ Important: Frontend is single-select, but Backend must support multi-assignment.

3.1 Multi-Service Assignment Requirement

A single worker profile must support multiple service types.

Example:

Worker “Saada” can simultaneously be:

- TRANSFER
- LOCAL
- HOURLY
- FLEXI (with multiple durations enabled)

This requires:

Service Type relationship = Many-to-Many.

3.2 FLEXI Duration Logic

- Duration is a separate entity.
 - Duration must only be linked when service_type = FLEXI.
 - A worker can have multiple FLEXI durations enabled (e.g., M1 + M6).
-

4. SEARCH FILTERING LOGIC (CRITICAL)

Filtering must behave as follows:

- If user selects TRANSFER → show all workers assigned TRANSFER
- If user selects LOCAL → show all workers assigned LOCAL
- If user selects HOURLY → show all workers assigned HOURLY
- If user selects FLEXI + M1 → show workers assigned FLEXI with M1 enabled
- If user selects FLEXI + M6 → show workers assigned FLEXI with M6 enabled

Filtering must be conditional and dynamic.

5. TECHNICAL STRUCTURE (RECOMMENDED)

Suggested Database Structure:

- Worker Table
- Worker_Service_Type (Many-to-Many relation)
- Worker_Flexi_Duration (Linked only when service_type = FLEXI)

This structure ensures:

- Accurate filtering
 - Clean reporting
 - Scalability
 - Future expansion (new service types)
-

6. RESERVATION & PURCHASE FLOW (IMPORTANT CONTEXT)

When a customer reserves a CV:

1. Reservation request is sent to the Recruiter/Agency.
2. Approval is required from recruiter.
3. After approval → system enables payment.
4. After payment → CV data is unlocked.

5. Ownership is displayed (e.g., “Belongs to Agency X”).
6. Direct communication occurs between employer and recruiter.
7. Platform does NOT act as intermediary in hiring.

7. CORE PRINCIPLES

- Frontend remains simple (Single Select for UX clarity).
- Backend supports Multi-Service flexibility.
- Duration visible only under FLEXI.
- Clean architecture.
- GCC market aligned structure.

Please confirm implementation approach and technical mapping before development proceeds.
